

It is insane to even consider BPL. It is no cleaner in spectrum than the old spark-gap transmitters, frequencies up to FM broadcast will be all but destroyed possibly endangering systems requiring certain communications and navigational systems not to mention Military and safety communications. Do NOT permit entirely destructive forms of communication, do NOT show your ignorance by allowing yourself to be swayed in your decision by payoffs and kickbacks from large corporations. There is NO VALID REASON to consider this system which has been outlawed by some countries already due to its destructive nature to critical communications systems. Where there is power there is telephone, despite the speed there is some form of connection to the web or other data systems. Where there is no power or telephone, battery and satellite systems are available which usually exceed that of the fastest broadband systems. This is a scam pure and simple with completely negative results and no benefits over existing systems.
